

Day 3 Lab Manual Part 2

BIVARIATE ANALYSIS IN R - COVARIANCE, CORRELATION, CROSSTAB

Exercise: 8

Reference	Status	Gender	TestNewOrFollowUp			
1	KRXH	Accepted	Female	Test1	New	
2	KRPT	Accepted	Male	Test1	New	
3	FHRA	Rejected	Male	Test2	New	
4	CZKK	Accepted	Female	Test3	New5	CQTN Rejected Female Test1
6	PZXW	Accepted	Female	Test4	Follow-up	
7	SZRZ	Rejected	Male	Test4	New	
8	RMZE	Rejected	Female	Test2	New9	STNX Accepted Female Test3
10	TMDW	Accepted	Female	Test1	New	New

i) Load the dataset and Create a data frame and name it as dataframe1 ii)

Load the function for crosstab

Note: [Perform status+gender](#)

Gender		
Status	Female	Male
Accepted	5	1
Rejected	2	2

Note: [Reference+Status](#)

Status		
Reference	Accepted	Rejected
CQTN	0	1
CZKK	1	0
FHRA	0	1
KRPT	1	0
KRXH	1	0
PZXW	1	0
RMZE	0	1
STNX	1	0
SZRZ	0	1
TMDW	1	0

SOURCE CODE:

```
# Load the dataset into a data frame called dataframe1
```

```
dataframe1 <- data.frame(
```

```
  Reference = c("KRXH", "KRPT", "FHRA", "CZKK", "CQTN", "PZXW", "SZRZ", "RMZE", "STNX",  
  "TMDW"),
```

```

Status = c("Accepted", "Accepted", "Rejected", "Accepted", "Rejected", "Accepted", "Rejected",
"Rejected", "Accepted", "Accepted"),

Gender = c("Female", "Male", "Male", "Female", "Female", "Female", "Male", "Female", "Female",
"Female"),

TestNewOrFollowUp = c("New", "New", "New", "New", "New", "Follow-up", "New", "New", "New",
"New")
)

```

```
# Load the function for crosstab
```

```
library(gmodels)
```

```
# Perform crosstab for Status+Gender
```

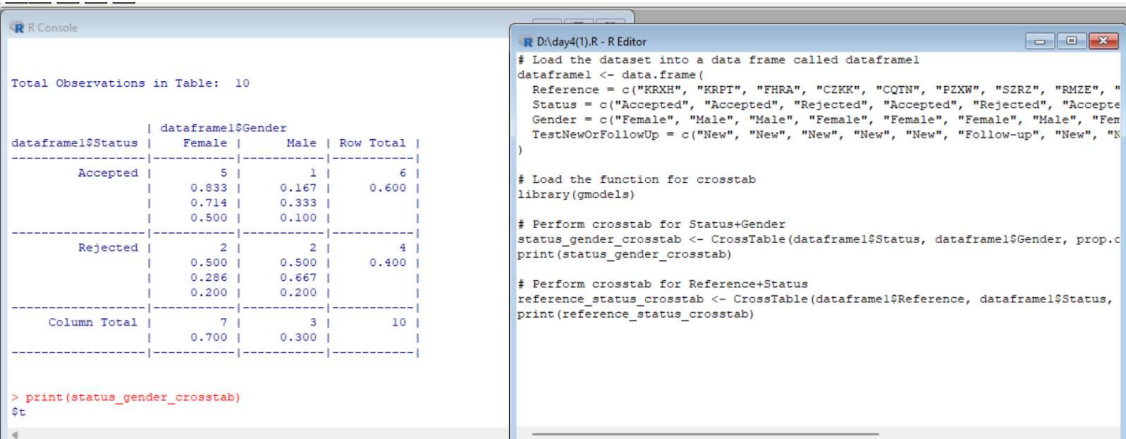

```
status_gender_crosstab <- CrossTable(dataframe1$Status, dataframe1$Gender, prop.chisq = FALSE)
```

```
print(status_gender_crosstab)
```

```
# Perform crosstab for Reference+Status
```

```
reference_status_crosstab <- CrossTable(dataframe1$Reference, dataframe1$Status, prop.chisq =
FALSE)
```

```
print(reference_status_crosstab)
```

The screenshot shows two windows from an R environment. The 'R Console' window on the left displays the output of the `print(status_gender_crosstab)` command, showing a table with 10 total observations. The 'R Editor' window on the right shows the R script being executed, which includes loading the `gmodels` library and performing two cross-tabulations: one for Status+Gender and another for Reference+Status.

Total Observations in Table: 10

dataframe1\$Status	dataframe1\$Gender		Row Total
	Female	Male	
Accepted	5	1	6
	0.833	0.167	0.600
	0.714	0.333	
	0.500	0.100	
Rejected	2	2	4
	0.500	0.500	0.400
	0.286	0.667	
	0.200	0.200	
Column Total	7	3	10
	0.700	0.300	

```

> print(status_gender_crosstab)
$c

```

```

# Load the dataset into a data frame called dataframe1
dataframe1 <- data.frame{
  Reference = c("KRXH", "KRPT", "FHRA", "CZKH", "QOIN", "PZXW", "SIRZ", "RMZE", "
  Status = c("Accepted", "Accepted", "Rejected", "Accepted", "Rejected", "Accepted", "Rejected", "Rejected", "Accepted", "Accepted"),
  Gender = c("Female", "Male", "Male", "Female", "Female", "Female", "Male", "Female", "Female", "Female"),
  TestNewOrFollowUp = c("New", "New", "New", "New", "New", "Follow-up", "New", "New", "New", "New")
}

# Load the function for crosstab
library(gmodels)

# Perform crosstab for Status+Gender
status_gender_crosstab <- CrossTable(dataframe1$Status, dataframe1$Gender, prop.chisq = FALSE)
print(status_gender_crosstab)

# Perform crosstab for Reference+Status
reference_status_crosstab <- CrossTable(dataframe1$Reference, dataframe1$Status, prop.chisq = FALSE)
print(reference_status_crosstab)

```

Exercise: 9

- i) Use Two Categorical Variables and Discover the relationships within a dataset
- ii) Next, using the xtabs() function, apply two variables from “dataframe1 “, to create a table delineating the relationship between the “Reference” category, and the “Status” category.
- iii) Save the file in the name of dataframe2

SOURCE CODE:

```
# Load the dataframe1 dataset

dataframe1 <- data.frame(

  Reference = c("KRXH", "KRPT", "FHRA", "CZKK", "CQTN", "PZXW", "SZRZ", "RMZE", "STNX",
"TMDW"),

  Status = c("Accepted", "Accepted", "Rejected", "Accepted", "Rejected", "Accepted", "Rejected",
"Rejected", "Accepted", "Accepted"),

  Gender = c("Female", "Male", "Male", "Female", "Female", "Female", "Male", "Female", "Female",
"Female"),

  TestNewOrFollowUp = c("New", "New", "New", "New", "New", "Follow-up", "New", "New", "New",
"New")

)

# Perform a frequency table of Reference and Status using xtabs()

dataframe2 <- xtabs(~ Reference + Status, data = dataframe1)

print(dataframe2)

# Display the relationship between Reference and Status as a percentage

prop.table(dataframe2, margin = 1) * 100
```

The screenshot shows two windows from an R environment. The 'R Console' window on the left displays the output of several commands. It first shows a table of 'Reference' categories (CQTN, CZKK, FHRA, KRPT, KRXH, PZXW, RMZE, STNX, SZRZ, TMDW) with their 'Accepted' and 'Rejected' counts. Then, it shows a command to calculate the percentage of 'Accepted' cases for each reference category, resulting in a table where 'Accepted' counts are 100 and 'Rejected' counts are 0 for all categories. The 'R Editor' window on the right shows the R code used to create a data frame 'dataframe1' with columns for Reference, Status, Gender, and TestNewOrFollowUp. It also shows commands to create 'dataframe2' using 'xtabs()' and to calculate the percentage of 'Accepted' cases for each reference category using 'prop.table()'.

```

R Console
Reference Accepted Rejected
CQTN      0      1
CZKK      1      0
FHRA      0      1
KRPT      1      0
KRXH      1      0
PZXW      1      0
RMZE      0      1
STNX      1      0
SZRZ      0      1
TMDW      1      0

>
> # Display the relationship between Refer
> prop.table(dataframe2, margin = 1) * 100
      Status
Reference Accepted Rejected
CQTN      0      100
CZKK     100      0
FHRA      0      100
KRPT     100      0
KRXH     100      0
PZXW     100      0
RMZE      0      100
STNX     100      0
SZRZ      0      100

R Editor
# Load the dataframe1 dataset
dataframe1 <- data.frame(
  Reference = c("KRXH", "KRPT", "FHRA", "CZKK", "CQTN", "PZXW", "SZRZ", "RMZE", "STNX",
    "TMDW"),
  Status = c("Accepted", "Accepted", "Rejected", "Accepted", "Rejected", "Accepted", "Rejected",
    "Rejected", "Accepted", "Accepted"),
  Gender = c("Female", "Male", "Male", "Female", "Female", "Female", "Male", "Female", "Female",
    "Female"),
  TestNewOrFollowUp = c("New", "New", "New", "New", "New", "Follow-up", "New", "New", "New",
    "New")
)

# Perform a frequency table of Reference and Status using xtabs()
dataframe2 <- xtabs(~ Reference + Status, data = dataframe1)
print(dataframe2)

# Display the relationship between Reference and Status as a percentage
prop.table(dataframe2, margin = 1) * 100

```

Exercise: 10

Use the same data frame using three Categorical Variables create a Multi-Dimensional Table

Apply three variables from “dataframe1” to create a Multi-Dimensional Cross-Tabulation of “Status“, “Gender“, and “Test“.

SOURCE CODE:

```
# Load the dataframe1 dataset
```

```
dataframe1 <- data.frame(
```

```
  Reference = c("KRXH", "KRPT", "FHRA", "CZKK", "CQTN", "PZXW", "SZRZ", "RMZE", "STNX",
    "TMDW"),
```

```
  Status = c("Accepted", "Accepted", "Rejected", "Accepted", "Rejected", "Accepted", "Rejected",
    "Rejected", "Accepted", "Accepted"),
```

```
  Gender = c("Female", "Male", "Male", "Female", "Female", "Female", "Male", "Female", "Female",
    "Female"),
```

```
  TestNewOrFollowUp = c("New", "New", "New", "New", "New", "Follow-up", "New", "New", "New",
    "New")
```

```
)
```

```
# Create a multi-dimensional table using xtabs()
```

```
dataframe3 <- xtabs(~ Status + Gender + TestNewOrFollowUp, data = dataframe1)
```

```
print(dataframe3)
```

```

R Console
> dataframe1 <- data.frame(
+   Reference = c("KRXH", "KRPT", "FHRA", "CZKK", "CQTN", "PZXW", "PEXW",
+   Status = c("Accepted", "Accepted", "Rejected", "Accepted", "R",
+   Gender = c("Female", "Male", "Male", "Female", "Female", "Fem",
+   TestNewOrFollowUp = c("New", "New", "New", "New", "New", "Fol
+ )
>
> # Create a multi-dimensional table using xtabs()
> dataframe3 <- xtabs(~ Status + Gender + TestNewOrFollowUp, data
> print(dataframe3)
, , TestNewOrFollowUp = Follow-up
      Gender
Status  Female Male
Accepted    1    0
Rejected    0    0

, , TestNewOrFollowUp = New
      Gender
Status  Female Male
Accepted    4    1
Rejected    2    2
> |

D:\day3(10).R - R Editor
# Load the dataframe1 dataset
dataframe1 <- data.frame(
  Reference = c("KRXH", "KRPT", "FHRA", "CZKK", "CQTN", "PZXW", "SZRZ", "RMZE", "
  Status = c("Accepted", "Accepted", "Rejected", "Accepted", "Rejected", "Accepte
  Gender = c("Female", "Male", "Male", "Female", "Female", "Female", "Male", "Fem
  TestNewOrFollowUp = c("New", "New", "New", "New", "New", "Follow-up", "New", "N
)
# Create a multi-dimensional table using xtabs()
dataframe3 <- xtabs(~ Status + Gender + TestNewOrFollowUp, data = dataframe1)
print(dataframe3)

```

Exercise: 11

Row Percentages

The R package “tigerstats” is required for the next two exercises.

- 1) Create an xtabs() formula that cross-tabulates “Status“, and “Test“.
- 2) Enclose the xtabs() formula in the tigerstats function, “rowPerc()” to display row percentages for “Status” by “Test“.

SOURCE CODE:

```
# Load the tigerstats package
```

```
library(tigerstats)
```

```
# Load the dataframe1 dataset
```

```
dataframe1 <- data.frame(
```

```
  Reference = c("KRXH", "KRPT", "FHRA", "CZKK", "CQTN", "PZXW", "SZRZ", "RMZE", "STNX",
  "TMDW"),
```

```
  Status = c("Accepted", "Accepted", "Rejected", "Accepted", "Rejected", "Accepted", "Rejected",
  "Rejected", "Accepted", "Accepted"),
```

```
  Gender = c("Female", "Male", "Male", "Female", "Female", "Female", "Male", "Female", "Female",
  "Female"),
```

```
  TestNewOrFollowUp = c("New", "New", "New", "New", "New", "Follow-up", "New", "New", "New",
  "New")
```

```
)
```

```
R Console
> datafram1 <- data.frame(
+   Reference = c("KRKH", "KRPT", "FHRA", "CZKK", "CQTN", "PZXW", "SZRZ",
+   Status = c("Accepted", "Accepted", "Rejected", "Accepted", "Rejected",
+   Gender = c("Female", "Male", "Male", "Female", "Female", "Female", "Male",
+   TestNewOrFollowUp = c("New", "New", "New", "New", "New", "Follow-up",
+ )
+
+ # Create a cross-tabulation of Status and Test using xtabs()
> xtab1 <- xtabs(~ Status + TestNewOrFollowUp, data = datafram1)
>
> # Display row percentages using rowPerc()
> rowPerc(xtab1)
      TestNewOrFollowUp
Status Follow-up New Total
Accepted      16.67  83.33 100.00
Rejected       0.00 100.00 100.00

D:\day3(11).R - R Editor
# Load the tigerstats package
library(tigerstats)

# Load the dataframe dataset
datafram1 <- data.frame(
  Reference = c("KRKH", "KRPT", "FHRA", "CZKK", "CQTN", "PZXW", "SZRZ", "RMZE",
  Status = c("Accepted", "Accepted", "Rejected", "Accepted", "Rejected", "Accepted",
  Gender = c("Female", "Male", "Male", "Female", "Female", "Female", "Male", "Female",
  TestNewOrFollowUp = c("New", "New", "New", "New", "New", "Follow-up", "New", "New",
)

# Create a cross-tabulation of Status and Test using xtabs()
xtab1 <- xtabs(~ Status + TestNewOrFollowUp, data = datafram1)

# Display row percentages using rowPerc()
rowPerc(xtab1)
```

```
Gender = c("Female", "Male", "Male", "Female", "Female", "Female", "Male", "Female", "Female",
"Female"),
```

```
# Create a cross-tabulation of Status and Test using xtabs()
xtabs1 <- xtabs(~ Status + TestNewOrFollowUp, data = dataframe1)

# Display column percentages using colPerc()
colPerc(xtabs1)
```

- SOURCE CODE:**

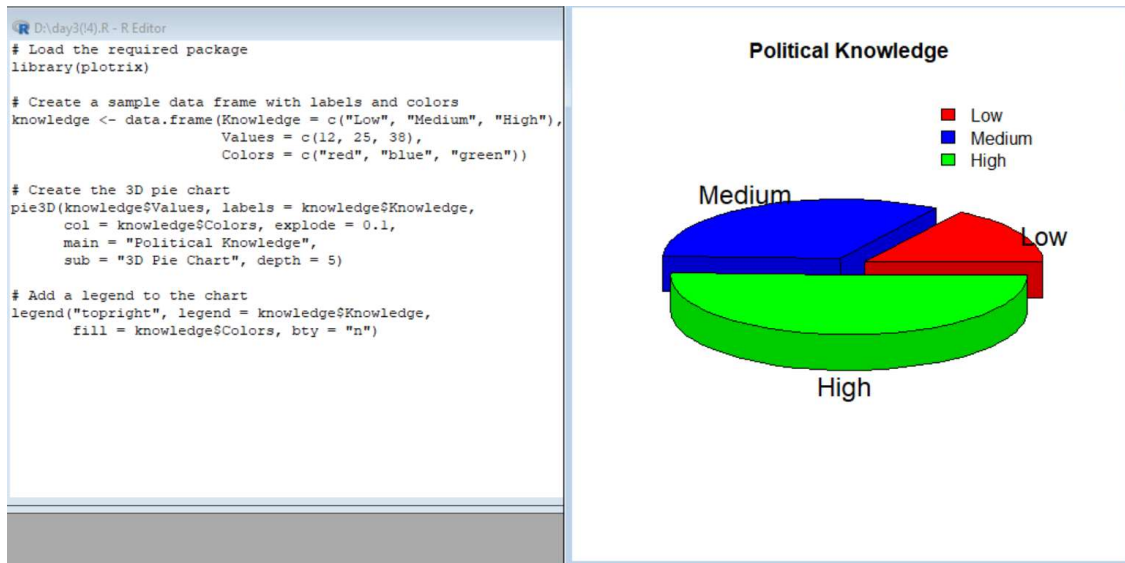

```
# Define the input vector
input_vector <- c(21, 62, 10, 53)

# Define the labels for the chart
labels <- c("London", "New York", "Singapore", "Mumbai")
```

```
# Add a legend to the chart
```

```
legend("topright", legend = knowledge$Knowledge,  
      fill = knowledge$Colors, bty = "n")
```

15. Write a program for creating a bar chart using the vectors $H=c(7,12,28,3,41)$ and $M=c(\text{"mar"}, \text{"apr"}, \text{"may"}, \text{"jun"}, \text{"jul"})$. Add a title to the chart as "Revenue chart".

SOURCE CODE:

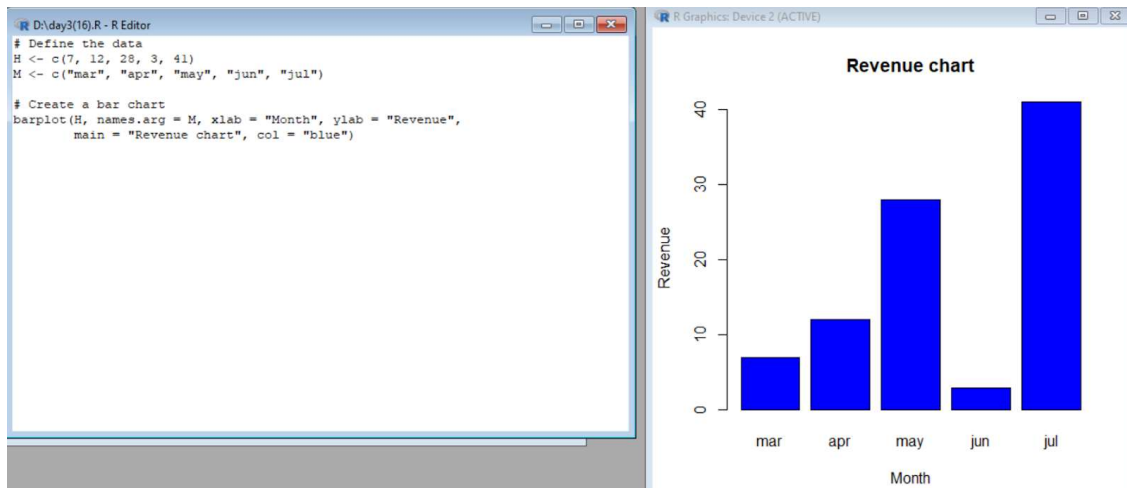

```
# Define the data
```

```
H <- c(7, 12, 28, 3, 41)
```

```
M <- c("mar", "apr", "may", "jun", "jul")
```

```
# Create a bar chart
```

```
barplot(H, names.arg = M, xlab = "Month", ylab = "Revenue",  
        main = "Revenue chart", col = "blue")
```

16. Make a histogram for the “AirPassengers” dataset, start at 100 on the x-axis, and from values 200 to 700, make the bins 200 wide

SOURCE CODE:

```
# Load the AirPassengers dataset
```

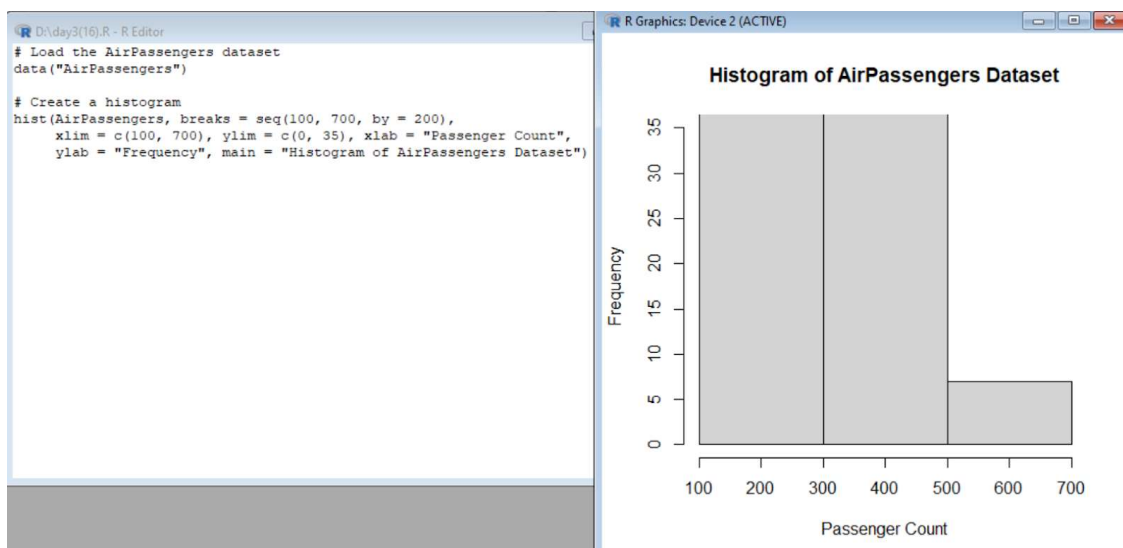

```
data("AirPassengers")
```

```
# Create a histogram
```

```
hist(AirPassengers, breaks = seq(100, 700, by = 200),
```

```
     xlim = c(100, 700), ylim = c(0, 35), xlab = "Passenger Count",
```

```
     ylab = "Frequency", main = "Histogram of AirPassengers Dataset")
```

17. Create a Boxplot graph for the relation between "mpg"(miles per gallon) and "cyl"(number of Cylinders) for the dataset "mtcars" available in R Environment.

SOURCE CODE:

```
# Load the mtcars dataset
```

```
data(mtcars)
```

```
# Create a boxplot
```

```
boxplot(mpg ~ cyl, data = mtcars,
```

```
        xlab = "Number of Cylinders",
```

```
        ylab = "Miles per Gallon",
```

```
        main = "Boxplot of MPG vs. Number of Cylinders")
```

```
D:\day3(17).R - R Editor
# Load the mtcars dataset
data(mtcars)

# Create a boxplot
boxplot(mpg ~ cyl, data = mtcars,
        xlab = "Number of Cylinders",
        ylab = "Miles per Gallon",
        main = "Boxplot of MPG vs. Number of Cylinders")
```
